OBJECTIVE

I am an aspiring fresh graduate who's working on starting my career in programming. I worked on a project for scanning (fingerprints, iris, and face), the program collects these scans and treats them using DCT and they're encrypted using PCA in Matlab. The main idea is to increase the security level and verification with FRR, FAR values. I worked in a team of 5 under academic supervision.

I also worked on a simple project using Python language, a game called (Tic Tac Toy) which I completed in 100 days.

I faced some tough days as I was working on both the graduation project and this project simultaneously, while keeping up with college exams, and I was able to get a good rating.

Below you can find a Github link which details the full project and workflow steps in weeks:
